Abstract. The current paper aims to analyse the importance of values of young employees now and in five years period. In order to achieve the aim, the questionnaire consisting of fifty statements was developed and disseminated between the Latvian students. The sample size was 392, which shows that the results represent the whole populations. For data processing, factor analysis was chosen as a tool. The data factorability was assessed via Bartlett's Test of Sphericity, Kaiser-Meyer-Olkin (KMO) statistic, initial estimates of communality and the anti-image correlation matrix. The factors were extracted via principal axis factoring (PAF). The number of factors was determined by the scree plot/Kaiser's rule and was equal to five in both cases. The results showed that for the young employees the essential values today are those connected to the personality trait. However, in five years, the essential values would be those that are linked to professional development.

Keywords: Z-Generation, values, factor analysis, professional development, employment.

JEL Classification: E24, M51, J13, A13.

Introduction

Z-Generation is the one that is discussed by several scientists. Many scholars pay their attention to technology and innovation adoption by representatives of Z-Generation (Quintanilha 2017, Roblek et al. 2019). However, there are only few studies concentrating on Z-Generations infusion to the labour market (Bejtkovsky 2013, Ruzsa 2018). Moreover, it was challenging to find any researches on the employees' representing Z-Generation values. Because of that, the idea of the current study was developed.

The idea of the current research emerged due to the lack of the studies, analysing the Z-Generation employees' values, and the personal engagement of the authors into the study process within management programmes. Being actively involved in teaching, we are interested in delivering relevant knowledge to our students in order to increase

their competitiveness in the labour market. The focus of the given study is a values mismatch. What is essential for young employees and does it correspond to the critical matters for employers?

Hence, the goal of the research was to evaluate the importance of values and behavioural aspects perceived by young employees. In order to achieve the research goal, 392 Latvian students from different educational fields were surveyed. The research instrument was the authors' developed questionnaire, the structure of which is described in the methodological section. Pre-determined values and behavioural aspects were offered to respondents for evaluation. Respondents were asked to evaluate the importance of each of 50 statements for themselves and employers, today and in the nearest future.

The current paper reflects the results of the survey, focusing only on students' answers regarding themselves. Data

*Corresponding author. E-mail: viktorija.skvarciany@vgtu.lt

processing was done in Excel and SPSS environment, applying such techniques as frequency analysis, as well as dimension reduction employing factor analysis.

The research results contribute to the scientific literature in the field of Z-Generations studies focused on the values from the employees' perspective. The developed questionnaire could be used for getting information regarding the values of young employees in different countries.

1. Literature review

Now, six generations are being defined by the researchers (Becton et al. 2014): 1) veterans/builders/traditionalists; 2) baby-boomers; 3) generation X; 4) generation Y (Millennials/me generation); 5) generation Z; 6) generation Alpha (Facebook generation/digital natives).

The most frequently the attention is focused on generational differences (Bencsik et al. 2016, Cennamo and Gardner 2011, Twenge et al. 2010). While existing studies are oriented towards concluding Z-Generation's behaviour based on comparisons to previous generations, in this paper, we undertake a different approach and assess Z-Generation from their views on their current state and desired future.

Z-Generation, covering the ones born after the year 2000, currently became an object for many studies that follow intensive research on Millennials. Scholars outline, that Z-Generation youngsters are digital natives (Popescu et al. 2019), born with the social web and "technology as their identity" (Singh and Dangmei 2016). According to mainstream research, this generation's values lead to the following preferences in the workplace: they are looking for transparency and self-reliance in their job (Mileski et al. 2016); their focus in work environment is value-oriented, and provide professional and personal development (Bridge 2015); looking for ambitious work goals as this generation intends to make a difference (Marron 2015).

Besides described above, other studies note significant behavioural differences between Z-Generation and Millennials, that within the values part include the following: higher trust to the opinion of previous generations (Mileski et al. 2016), more pursuit towards privacy and higher level of risk aversion (Seemiller and Grace 2016), digitalisation of the whole lifecycle (Barron 2014) Hence, one can await that Z-Generation would be more oriented towards the values of success, privacy, security and making a difference; however, the set of existing experiments evaluating the needs of this generation had come to diverse conclusions, which leads to the investigation on generation's goal orientation.

Due to analysed controversy, Z-Generation awakes several conclusions on its proposed workplace behaviour, that has not been proven yet as the Z-people are at most 18 years old and have not yet entered their full-time jobs. Still,

researchers argue that this generation would have the skills to work on a few tasks at the same time without losing efficiency (Adecco 2019, Ozkan and Solmaz 2015). Moreover, they would demonstrate self-confidence above average due to higher innovation and creativity (Half 2015, Roblek et al. 2019) that lead to their intention to work alone rather than be involved in the teamwork – despite their ability to make the most out of globalisation (Addor 2011). At the same time, this generation respects authority and does not intend to question it (Tulgan 2013); hence the majority of them enter job environment without the prior development of soft skills, requesting such development from the employer (Tulgan 2013). This assessment of workplace development leads Z-Generation to midsize companies or international corporations, where professional and personal development usually is a part of career management (Half 2015). Finally, Z-Generation is reported to be more realistic in their demand towards employer compared to previous generations (Tulgan 2013).

These features, along with biological differences reported by medical research (average attention concentration of 7 seconds compared to 15 seconds on generation X, ability to process multilevel data with the help of natively used technology, higher efficiency in multitasking environment (Bridge 2015, Half 2015, Tulgan 2013) led to speculative conclusions on Z-Generation's possible behaviours in the workplace. However, it is quite questionable and under-researched whether Z-Generation carries out such commonly named values as technology orientation, desire to proceed with multiple tasks, individualisation (as opposite to teamwork), ambitious goals, personal development and professional growth, environmental concern (West 2014).

2. Methodology

To find out what values are and will be necessary for young employees – the authors surveyed Latvian students. The authors' developed questionnaire was used. The first variant of the questionnaire was developed within the framework of the state programme "Strategic planning of talents in the Republic of Tatarstan for 2015–2020", specifically in the process of the development and approbation of the monitoring system. The suggested evaluation/monitoring system was based on the methodology, developed by the Barrett Values Centre based on the analysis of the World Bank's data about organisational culture management data. The above-mentioned evaluation system incorporated approximately 100 values (personal and organisational) grouped into seven categories of values required for a company's viability.

For the purposes of the current research, the questionnaire was simplified – only 50 values were remained and offered to the respondents for assessment. Others, with a high level of similarity, were excluded.

The questionnaire consisted of two main sections: section I – respondent profile; section II – values and behavioural aspects. The structure of the questionnaire is presented in Table 1.

Table 1. Structure of the questionnaire (source: developed by authors)

Section I	Respondent profile	Comments
Q1	Gender	Closed: 2 alternatives
Q2	Age	Opened
Q3	Place of birth	Opened
Q4	Employment status	Closed: 3 alternatives
Section II	Values and behavioural aspects	Comments
Q1	What students consider being important today?	50 statements for evaluation; 5-point scale
Q2	What students consider being important in 5 years?	
Q3	What employers consider being important today (on the viewpoint of students)?	
Q4	What employers consider being important in 5 years (on the viewpoint of students)?	

Responses on the questions Q3 and Q4 of section II were not analysed within the current research.

After the questionnaire development, the method of the respondents' view assessment had to be chosen. Actually, scholars working in the field of social sciences use various scales: for instance, Stapel scale (Ahmed et al. 2014, Sreejesh et al. 2014), semantic differential scale (Ciabuca 2015, Kahveci 2015), Likert scale (Ariani 2017, Breffle et al. 2011, Mouselli and Khalifa 2017, Petsky et al. 2012). However, the Likert scale method is the most popular one because of its ease of use. Hence, the interviewees were offered to use Likert 5-point scale for grading. The respondents ought to evaluate the statements on a five-scale basis, i.e. the respondents had to indicate the level of his/her consent/disagreement with the submitted statement, where "1" indicated "absolutely not important" and "5" – "critically important". Statements offered to respondents for evaluation, as well as their labels used in data analysis, are presented in Table 2.

All the statements presented in Table 2 had to be answered in two different concepts. The respondents had to evaluate which of the values are essential for them to now and which would be significant in five years. The sample consisted of 392 Latvian students with a different educational background from different universities. Distribution of the respondents according to the gender criterion was 32% and 68%, females and males, respectively. The average age of the respondents was 23 years. Most of the respondents were from Riga (41%).

Table 2. Statements for evaluation (source: developed by authors)

No.		No.	
1	Encouraging and supporting of my talent	26	Teamwork
2	Identifying strengths; recognition of an employee's achievements	27	Results' orientation
3	Enthusiasm; initiative	28	Adaptability
4	Creativity	29	Practice
5	Balance of the work/ home/free time	30	Ability to act in uncertain conditions
6	Trustworthiness	31	Authority
7	Attention to me; empowerment of my abilities	32	Ability to set goals
8	Opportunity to show myself	33	Ability to act according to plan
9	Balance of the spiritual / physical / intellectual / emotional	34	Decision making skills
10	Continuous improvement and training	35	Responsibility
11	Control; exactingness	36	Success
12	Variety of tasks	37	The trust
13	Opportunity for specialization	38	Honesty
14	Competitive spirit; opportunity to overtake others	39	Ambitiousness
15	Independence	40	Image and reputation
16	My personal development plan	41	Ability to convince
17	Ethics	42	Ability to use chances
18	Support, explanations; tips	43	Social guarantees
19	Experience, masterliness	44	Listening skills
20	Joint discussion	45	Process' orientation
21	Financial stability	46	Long-term perspective
22	Perspective	47	Communicability
23	Mutual help and cooperation	48	Attentiveness
24	Ability to change things	49	Work on yourself
25	Quality of work	50	Self-presentation

62% of respondents are currently employed; 31% – were employed in the past, and 7% have never worked and are not employed now. Initial analysis was performed by calculating “average” and applying the procedure of ranking.

The number of factors was quite high, hence, additionally to ranking procedure dimension reduction was used. Dimension reduction was performed for both Q1 and Q2 data sets using factor analysis – specifically Principal Component Analysis (PCA). In fact, factor analysis is widely used by scholars analysing working in the field of social sciences and researching a significant amount of data (Durana et al. 2019, Lentjusenkova et al. 2016).

First of all, the data ought to be tested for suitability for factor analysis. For that issue, many scientists working in the field of educational sciences choose Kaiser-Meyer-Olkin (KMO) test and Bartlett’s Test of Sphericity (BTS) (Jamil et al. 2015, Kurtuldu and Bulut 2017, Moto et al. 2018, Sever 2014).

Bartlett’s Test of Sphericity is used in order to find out if the collected answers are valid for the factor analysis. If the Bartlett’s Sphericity c_2 is lower than the significance level α , it means that the data could be employed for the factor analysis. Bartlett’s Sphericity c_2 is calculated using formula (1).

$$\chi^2 = \frac{\left(\sum_{i=1}^k n_i - k \right) \ln s_p^2 - \sum_{i=1}^k (n_i - 1) \ln s_i^2}{1 + \frac{1}{3(k-1)} \left(\sum_{i=1}^k \frac{1}{n_i - 1} - \frac{1}{\sum_{i=1}^k n_i - k} \right)}, \quad (1)$$

where: s_i^2 – pooled estimate for the variance; k – number of samples; n_i – sample size.

Kaiser-Meyer-Olkin Measure (KMO) is employed in order to test the data adequacy. The higher is the KMO value; the higher is factor analysis validation. The KMO is calculated using the below-presented formula (2).

$$KMO = \frac{\sum \sum_{i \neq j} r_{ij}^2}{\sum \sum_{i \neq j} r_{ij}^2 + \sum \sum_{i \neq j} a_{ij}^2}, \quad (2)$$

where: r_{ij} – correlation coefficient variables X_i and X_j ; a_{ij} – the partial correlation coefficient of the variables X_i and X_j .

All the statistical analysis procedures were performed using SPSS 26.0 environment.

3. Empirical findings

First, all the data was ranked by “average”. According to the results of the ranking procedure, the essential values and behavioural aspects today on the viewpoint of students are “Quality of work”, “Work on yourself”, “Honesty”, “Responsibility” and “Opportunity to show yourself”. Least important in students’ perception are “Encouraging and supporting of my talent”, “Control; exactingness”, “Competitive spirit; opportunity to overtake others”, “Joint discussion” and “Authority”.

However, the distribution of the ranks of today’s values differs from the ranks of values necessary in the future. “Quality of work”, “Responsibility” and “Work on yourself” remained in top-five. However, “financial stability” was placed in the first position. The fourth place was given to “Decision-making skills”. Least important values did not change their positions on the list.

Comparing results with other value studies, the authors consider that at least to a certain extent the results are aligned with the results from the previous studies. For instance, Bencsik et al. (2016) characterize Z generation representatives attitudes to teamwork and collaboration, as follows:

- Teamwork – “on a virtual level (only if forced)”;
- Relationship – “virtual and superficial”.

Analyzing today’s attitudes, “teamwork” was placed at 37th place, “mutual help and cooperation” and “joint discussion” (which can be considered as substitutes for “relationship”) at 38th and 49th place, respectively. Importance tomorrow is even less – 39th, 40th and 50th place, respectively. Thus, Z-people appreciates independence. By the way, “independence” was on 10th place for today and 9th place for tomorrow.

Bridge (2015) stated that Gen Z prefers work environment with professional development opportunities. “Continuous improvement and training” was placed on the 9th position on today’s value list. Only 21st place among tomorrow values, but it can be explained with students’ higher perceived experience/knowledge in their future.

Another example – McKinsey survey (Francis and Hoefel 2018). The McKinsey experts revealed “Gen Z behaviours, all anchored in one element: this generation’s search for truth.” Assuming the synonymity between “truth” and “honesty”, this was also confirmed in the current study: the 3rd and the 6th place, respectively in “today” and “tomorrow” list.

The ranking itself, probably, cannot lead to particular conclusions, considering a large number of elements. However, these results are useful in the next stage of analysis – dimension reduction.

Before the dimension reduction procedure, the data were tested for suitability for factor analysis. The results of the performed tests are provided in Table 3.

KMO value was computed in order to understand whether the data set was appropriate for the analysis and the results were 0,913 for section II – Q1 data and 0,904 for Q2 data (see Table 3). The KMO value shows that the data was appropriate for the factor analysis according to a very high test result. Bartlett’s test of Sphericity was significant both for Q1 and Q2 data with chi-square test values of 7381,906 ($df = 1225$, $p = 0,000$) and 6744,177 ($df = 1225$, $p = 0,000$) respectively, demonstrating that factor analysis was adequate to the observed data.

Factor analysis of Q1 data. The initial stage of PCA (based on eigenvalues greater than 1) yielded 12 components containing 1 to 4 elements with factor loadings higher than

0.5. Following the experience of other researchers, who fix the number of factors (usually basing the decision on interpretability criterion), the authors of the given research fixed the number at 5. The resulting rotated component matrix is presented in Table 4 (elements with factor loadings less than 0,5 were removed).

Factor analysis of Q2 data. The number of components was fixed at five in order to get consistent results. The resulting rotated component matrix is presented in Table 5 (elements with factor loadings less than 0,5 were removed).

As it could be seen from Table 4, twenty-five elements were left in the questionnaire, and five factors were extracted. According to the results, the most important values for young employees now are those combined in the first factor: honesty, listening skills, ability to convince, trust, decision-making skills, self-presentation, and attentiveness. Actually,

Table 3. KMO and Bartlett's Test
(source: authors' calculations)

Section II Q1 data	Kaiser-Meyer-Olkin (KMO) Measure of Sampling Adequacy		0.913
	Bartlett's Test of Sphericity	Approx. Chi-Square	7381,906
		df	1225
		Sig.	0.000
Section II Q2 data	Kaiser-Meyer-Olkin (KMO) Measure of Sampling Adequacy		0.904
	Bartlett's Test of Sphericity	Approx. Chi-Square	6744,177
		df	1225
		Sig.	0.000

Table 4. PCA analysis of section II – Q1 data (source: authors' calculations)

	Component				
	F1	F2	F3	F4	F5
Honesty (statement 3)	0.620				
Listening skills (statement 20)	0.602				
Ability to convince (statement 35)	0.564				
Trust (statement 11)	0.560				
Decision-making skills (statement 6)	0.548				
Responsibility (statement 4)	0.543				
Self-presentation (statement 14)	0.523				
Attentiveness (statement 30)	0.504				
Trustworthiness (statement 41)		0.639			
Attention to me; empowerment of my abilities (statement 21)		0.604			
Balance of the spiritual/physical/intellectual/emotional (statement 34)		0.598			
Balance of the work/home/free time (statement 17)		0.509			
Variety of tasks (statement 42)		0.503			
Encouraging and supporting of my talent (statement 46)		0.500			
Results' orientation (statement 25)			0.615		
Experience, masterliness (statement 23)			0.555		
Adaptability (statement 27)			0.514		
Enthusiasm; initiative (statement 15)			0.511		
Continuous improvement and training (statement 9)			0.510		
Competitive spirit; opportunity to overtake others (statement 48)				0.662	
Authority (statement 50)				0.641	
Ambitiousness (statement 44)				0.572	
Social guarantees (statement 33)					0.661
Financial stability (statement 7)					0.646
Joint discussion (statement 49)					0.547

almost all these variables are connected to the skills that are linked to human characteristics, which could be explained by the fact that millennials are more focused on intangible values.

Table 5 presents the result of the factor analysis for section II – Q2 data, i.e. for the values that would be important for young employees in five years. In that case, twenty-six variables/items were left in the questionnaire, and five factors were extracted. The first factor explains about thirty per cent of variance; hence, the values, combined in that factor could be treated as the most essential. Listening skills remain in the first factor; however, other values differ. Additionally, to listening skills, the factor includes Balance of the spiritual/physical/intellectual/emotional state, ability to change skills, continuous improvement and training, perspective, quality of work, and adaptability.

To sum up, from the viewpoint of the students, representing Z-generation, regarding the values that are vital today, it could be stated that all the values are linked to personal character traits, empathy. However, the values that would be critical in five years are connected to professional development and moving up the career ladder.

Conclusions

The current study aimed to explore which values are essential for the young employees, representing Z-generation, at the current moment and in five years time period. For gathering the data, the questionnaire containing fifty elements was developed. The students had to answer the same questions considering different time (now and in five years). In both cases, five factors were extracted.

Table 5. PCA analysis of section II – Q2 data (source: authors' calculations)

	Component				
	1	2	3	4	5
Balance of the spiritual/physical/intellectual/emotional state (statement 37)	0.668				
Ability to change things (statement 33)	0.598				
Continuous improvement and training (statement 21)	0.559				
Perspective (statement 15)	0.554				
Quality of work (statement 2)	0.549				
My personal development plan (statement 28)	0.549				
Adaptability (statement 27)	0.532				
Listening skills (statement 14)	0.502				
Honesty (statement 6)		0.640			
Self-presentation (statement 12)		0.635			
Work on yourself (statement 5)		0.634			
Responsibility (statement 3)		0.586			
Decision-making skills (statement 4)		0.535			
Ability to set goals (statement 16)		0.507			
Encouraging and supporting of my talent (statement 47)			0.576		
Joint discussion (statement 50)			0.558		
Support, explanations; tips (statement 35)			0.510		
Social guarantees (statement 20)			0.503		
Authority (statement 49)				0.668	
Success (statement 45)				0.584	
Image and reputation (statement 36)				0.556	
Ability to convince (statement 30)				0.556	
Ability to use chances (statement 38)				0.503	
Competitive spirit; opportunity to overtake others (statement 48)					0.555
Ability to act in uncertain conditions (statement 41)					0.545
Ability to act according to plan (statement 24)					0.520

Talking about section II – Q1 dataset, the first involves the values that are connected to personal traits. This factor explains about thirty per cent of variance; hence, the values it combines could be treated as the most essential. The second factor consists of the values that are related to the work environment. The third one includes the values that could be summarised as motivation. The fourth factor could be explained as competitiveness, and the fifth one is related to a comfortable existence.

However, the situation is different if we talk about the values that would be important for students in future (section II – Q1 dataset). In that case, the first factor includes items that are linked to professional development. The second factor involves the values of personal traits. Most of the values of the second factor were included in the first factor in the case of section II – Q1 (today's values) data. The last three factors are almost the same as in the case of section II – Q1 data.

The current study results contribute to scientific researches in the field of values of young employees, representing Z-generation. Apart of the values mentioned in the previous studies, the current research revealed some new ones – for example, “balance of work/home/free time”, “opportunity to show me” or “self-presentation”. All these values were placed to upper positions both in “today” and “tomorrow” list (today – 17th, 5th, 14th and tomorrow – 8th, 10th, 12th place, respectively).

The extracted factors are useful for further researches, where the weights for each of the factor are going to be assigned using multi-criteria decision-making methods.

Considering the limitation of the current study (only students' own values were analysed), the next research will be focused on students' current and future perception of employers' values.
