Abstract. The combined quasi-neutral and inviscid limit of the Navier-Stokes-Poisson-Korteweg system with density-dependent viscosity and cold pressure in the torus $T^3$ is studied. It is shown that, for the well-prepared initial data, the global weak solution of the Navier-Stokes-Poisson-Korteweg system converges strongly to the strong solution of the incompressible Euler equations when the Debye length and the viscosity coefficient go to zero simultaneously. Furthermore, the rate of convergence is also obtained.

Keywords: incompressible Euler equations, inviscid limit, Navier-Stokes-Poisson-Korteweg system, quasi-neutral limit.

AMS Subject Classification: 35Q35; 35B40; 76N10.

1 Introduction and main results

Hydrodynamical models have been widely used to describe the physical phenomena in plasmas and semiconductors physics [21]. In the inviscid case, the Euler-Poisson system has been extensively studied. In the viscous case, where the viscous stress tensors are taken into consideration, the most common model is the compressible Navier-Stokes-Poisson system. Moreover, in the particular case, it is necessary to add to the momentum equation a capillarity tensor if we take under consideration the surface tension effects. This type of models was first introduced by Korteweg [16], and derived rigorously by Dunn and Serrin [10]. In this paper, we are concerned with the rigorous asymptotic analysis...
of the following scaled Navier-Stokes-Poisson-Korteweg (NSPK) system
\begin{align}
\partial_t n + \text{div}(nu) &= 0, \\
\partial_t (nu) + \text{div}(nu \otimes u) + \nabla (p(n) + p_c(n)) &= \nabla \Phi + 2\mu \text{div}(n D(u)) + \kappa n \Delta n, \\
- \lambda^2 \Delta \Phi &= n - 1
\end{align}
(1.1)
(1.2)
(1.3)
with initial data
\[ n(x,0) = n_0, \quad u(x,0) = u_0, \quad \Phi(x,0) = \Phi_0 \]
satisfying compatibility condition
\[- \lambda^2 \Delta \Phi_0 = n_0 - 1 \]
for \( x \in \mathbb{T}^3, t > 0 \). Here, \( \mathbb{T}^3 \) is the torus in \( \mathbb{R}^3 \). \( \mu > 0 \) denotes viscosity coefficient, \( \kappa > 0 \) is the Weber number and \( \lambda > 0 \) is the Debye length. The unknown functions are the density \( n \), the velocity \( u \) and the electrostatic potential \( \Phi \), respectively. In this paper, we suppose that \( p(n) = a^2 n^\gamma \) with constants \( \gamma > 1 \) and \( a \neq 0 \). The cold pressure \( p_c(n) \) is a singular continuous function namely a suitable increasing function as introduced in [3]. More precisely, we assume that \( p_c(n) = -\frac{3a^2 \epsilon}{2(\gamma - 1)n^2} \) for some constant \( \epsilon > 0 \). \( D(u) = \frac{1}{2}(\nabla u + \nabla u^T) \) is the symmetric part of the velocity gradient.

Recently, Li-Yong [20] proved that the quasi-neutral limit \( \lambda \to 0 \) of the NSPK system (1.1)–(1.3) with common viscosity and without cold pressure is the following incompressible Navies-Stokes equations:
\begin{align}
\partial_t u^0 + (u^0 \cdot \nabla) u^0 + \nabla p^0 &= \mu \Delta u^0, \\
\text{div} u^0 &= 0
\end{align}
(1.4)
for (local) smooth solution in the two or three dimensional torus.

Our objective of this paper is to justify rigorously the convergence of the NSPK system (1.1)–(1.3) to the following ideal incompressible Euler equations
\begin{align}
\partial_t u^\lambda + (u^\lambda \cdot \nabla) u^\lambda + \nabla p^\lambda &= 0, \\
\text{div} u^\lambda &= 0
\end{align}
(1.4)
for global weak solutions by performing the combined quasi-neutral and vanishing viscosity limit \( \lambda \to 0 \) and \( \mu \to 0 \) in the torus \( \mathbb{T}^3 \). In this paper, we assume that \( \mu = O(\lambda) \). Let \( \Psi^\lambda = \lambda \Phi \) and rewrite the NSPK system (1.1)–(1.3) into the following form
\begin{align}
\partial_t n^\lambda + \text{div}(n^\lambda u^\lambda) &= 0, \\
\partial_t (n^\lambda u^\lambda) + \text{div}(n^\lambda u^\lambda \otimes u^\lambda) + \nabla (p(n^\lambda) + p_c(n^\lambda)) &= \frac{n^\lambda \nabla \Psi^\lambda}{\lambda} + 2\mu \text{div}(n^\lambda D(u^\lambda)) + \kappa n^\lambda \Delta n^\lambda, \\
- \lambda \Delta \Psi^\lambda &= n^\lambda - 1
\end{align}
(1.5)
(1.6)
(1.7)
with initial data
\[ n^\lambda(x,0) = n_0^\lambda, \quad u^\lambda(x,0) = u_0^\lambda. \]
Before stating our main result, we first recall the local existence of strong solution to the incompressible Euler equations (1.4) and the global existence of weak solution to the NSPK system (1.5)–(1.7).

**Proposition 1.** (Ref. [15]) Let $s > \frac{5}{2} + 1$ be an integer. Assume that the initial data $u^0(x, 0) = u_0^0(x)$ satisfies $u_0^0 \in H^s(\mathbb{T}^3)$ and $\text{div} u_0^0 = 0$. Then there exists a $T_0 > 0$ and a unique solution $u^0 \in L^\infty([0, T]; H^s(\mathbb{T}^3))$ to the incompressible Euler equations (1.4) with the initial data $u_0^0(x)$ satisfying for any $T \in (0, T_0)$

$$\sup_{t \in [0, T]} (\|u^0_t, \nabla p^0\|_s + \|\partial_t u^0, \partial_t \nabla p^0\|_{s-1}) \leq C_T \tag{1.9}$$

for some positive constant $C_T$, depending only on $T$.

Yang-Wang-Ding [30] prove the existence of global weak solutions to system (1.1)–(1.3) by using the Faedo-Galerkin approximation method the compactness argument.

**Proposition 2.** ([30]) Let $T > 0$. Assume that the initial data $(n_0^\lambda, \ell_0^\lambda, \Psi_0^\lambda)$ satisfy (1.8) and the compatibility condition $\int_{\mathbb{T}^3} (n_0^\lambda - 1) dx = 0$, where $\Psi_0^\lambda$ is given by $-\lambda \Delta \Psi_0^\lambda = n_0^\lambda - 1$. Then there exists a weak solution $(n^\lambda, \ell^\lambda, \Psi^\lambda)$ of (1.5)–(1.7).

1. $n^\lambda \in L^\infty([0, T]; L^2(\mathbb{T}^3))$, $\nabla n^\lambda \in L^\infty([0, T]; L^2(\mathbb{T}^3))$, $\frac{1}{n^\lambda} \in L^\infty([0, T]; L^2(\mathbb{T}^3))$, $\nabla (\frac{1}{n^\lambda}) \in L^\infty([0, T]; L^2(\mathbb{T}^3))$, $\sqrt{n^\lambda} u^\lambda \in L^\infty([0, T]; L^2(\mathbb{T}^3))$, $\sqrt{n^\lambda} |\nabla u^\lambda| \in L^2([0, T]; L^2(\mathbb{T}^3))$, $\nabla \Psi^\lambda \in L^\infty([0, T]; L^2(\mathbb{T}^3))$, $\Delta \Psi^\lambda \in L^2([0, T]; L^2(\mathbb{T}^3))$.

2. The energy inequality

$$E^\lambda(t) + 2\mu \int_0^t \int_{\mathbb{T}^3} n^\lambda |D(u^\lambda)|^2 dx d\tau \leq E^\lambda(0) \tag{1.10}$$

holds with the finite total energy

$$E^\lambda(t) = \frac{1}{2} \int_{\mathbb{T}^3} (n^\lambda |u^\lambda|^2 + h(n^\lambda) + \kappa |\nabla n^\lambda|^2 + |\nabla \Psi^\lambda|^2) dx,$$

where

$$h(n^\lambda) = \frac{2a^2}{\gamma - 1} \left[ (n^\lambda)^\gamma - 1 - (\gamma - \epsilon)(n^\lambda - 1) + \frac{\epsilon}{2} \left( \frac{1}{(n^\lambda)^2} - 1 \right) \right]$$

is a convex on $[0, +\infty)$ since $\gamma > 1$.

3. The system (1.5)–(1.7) holds in $\mathcal{D}'(\mathbb{T}^3 \times (0, +\infty))$.

Throughout this article, we use $C$ to denote the positive constant independent of $\lambda$ and $\mu$, which can be different from line to another line. The main result of this paper reads as follows.

Theorem 1. Assume that the initial data \((n^\lambda_0, u^\lambda_0, \Psi^\lambda_0)\) satisfy the assumptions in Proposition 2. Assume further that they satisfy

\[
\int_{T^3} h(n^\lambda_0) dx + \left\| \nabla n^\lambda_0 \right\|^2_{L^2(T^3)} + \left\| \sqrt{n^\lambda_0} u^\lambda_0 - u^0 \right\|_{L^2(T^3)}^2 + \left\| \nabla \Psi^\lambda_0 \right\|^2_{L^2(T^3)} \leq C\lambda. \tag{1.11}
\]

Let \(u^0\) be the smooth solution, defined on \([0, T_\ast]\), to the incompressible Euler equations (1.4) with initial data \(u^0_0\). Then for any \(0 < T < T_\ast\), the global weak solution \((n^\lambda, u^\lambda, \Psi^\lambda)\) of the NSPK system (1.5)–(1.7) satisfies the following estimates

\[
\left\| n^\lambda - 1 \right\|_{L^\infty([0, T]; L^\gamma(T^3))} \leq C\lambda \min\{\frac{\gamma^2}{4}, 1\}, \tag{1.12}
\]

\[
\left\| \sqrt{n^\lambda} u^\lambda - u^0 \right\|_{L^\infty([0, T]; L^2(T^3))} \leq C\lambda \min\{\frac{\gamma^2}{4}, 1\}, \tag{1.13}
\]

\[
\left\| \nabla n^\lambda \right\|_{L^\infty([0, T]; L^2(T^3))} \leq C\lambda \min\{\frac{\gamma^2}{4}, 1\}, \tag{1.14}
\]

\[
\left\| \nabla \Psi^\lambda \right\|_{L^\infty([0, T]; L^2(T^3))} \leq C\lambda \min\{\frac{\gamma^2}{4}, 1\}, \tag{1.15}
\]

\[
\left\| n^\lambda u^\lambda - u^0 \right\|^2_{L^\infty([0, T]; L^\frac{2\gamma}{\gamma+1}(T^3))} \leq C\lambda \min\{\frac{\gamma^2}{4}, 1\}. \tag{1.16}
\]

Remark 1. Theorem 1 describes the combined quasi-neutral and vanishing viscosity limit of the NSPK system (1.5)–(1.7) with well-prepared initial data. For the general initial data, there are oscillations in time of the solution sequence because the oscillation part with respect to time \(\frac{2}{\lambda}\) does not vanish. It is more difficult to prove the asymptotic limit in this situation, which will be studied in our future work.

The proof of Theorem 1 is based on the modulated energy method, first introduced by Brenier in a kinetic context [2] and later extended to various models, e.g. [1,14,18,27]. The idea of modulated energy method is to modulate the energy of the given system by test functions, and to obtain a stability inequality when these test functions are the solution to the limiting system. Noticing that our result is different from that in Ref. [20], where the convergence of (local) smooth solution of the NSPK system with viscosity term \(\mu \Delta u^\lambda + \nu \nabla \text{div} u^\lambda\) to the smooth solution of the incompressible Navier-Stokes equations is obtained by using the convergence-stability principle. It is also different from that in Ref. [4], where the limit system is the compressible capillary Navier-Stokes equations. In this paper, we consider the convergence of global weak solution of the NSPK system with density-dependent viscosity term \(\mu \text{div}(nD(u^\lambda))\) and cold pressure term \(p_c(n^\lambda)\) to the smooth solution of the incompressible Euler equations by using the relative entropy theory.

Before ending this introduction, let us mention that the quasi-neutral limit of fluid dynamic models and of kinetic models of semiconductors and plasmas has attracted much attention. In particular, the quasi-neutral limit \(\lambda \to 0\) has been studied in Vlasov-Poisson system by Brenier [2], Grenier [12] and Masmoudi [22], in drift-diffusion model by Gasser et al. [11], Wang et al. [28], in Euler-Poisson system by Cordier-Grenier [5], Wang [26], Peng et al. [24] and Slemrod-Sternberg [25], in Navier-Stokes-Poisson system by Wang-Jiang
Inviscid Quasi-Neutral Limit of a Navier-Stokes-Poisson-Korteweg System

[27], Ju et al. [13], Donatelli et al. [6], Donatelli-Marcati [7], in Navier-Stokes-Fourier-Poisson system by Donatelli-Marcati [8], in Euler-Maxwell system [23], in electro-diffusion system by Li [17], in quantum hydrodynamic model by Li [18], Li-Lin [19] and Yang-Ju [29], in Korteweg type fluids by Donatelli-Marcati [9].

The remainder of this paper is devoted to proving Theorem 1.

2 Proof of Theorem 1

We define the modulated energy functional $H^\lambda(t)$ by

$$H^\lambda(t) = \frac{1}{2} \int_{T^3} \left\{ n^\lambda |u^\lambda - u^0|^2 + h(n^\lambda) + \kappa |\nabla n^\lambda|^2 + |\nabla \psi^\lambda|^2 \right\} dx,$$

where $u^0$ is the smooth solution of the incompressible Euler equations (1.4). These terms express the differences of the kinetic energy, internal energy, Korteweg energy and electric field energy. Using the careful energy method, we are able to prove that

$$H^\lambda(t) \leq C \int_0^t H^\lambda(\tau) d\tau + C\lambda^\theta$$

with some positive constant $\theta$. The Gronwall lemma then implies $H^\lambda(t) \to 0$ as $\lambda \to 0$, which yields the desired convergence results.

To derive the integration inequality for $H^\lambda(t)$, we use $u^0$ as a test function in the weak formulation of momentum equation (1.6) to yield the following equality for almost all $t$.

$$\int_{T^3} n^\lambda u^\lambda \cdot u^0 dx = \int_{T^3} n^\lambda_0 u^\lambda_0 \cdot u^0 dx + \int_0^t \int_{T^3} n^\lambda u^\lambda \cdot \partial_\tau u^0 dx d\tau$$

$$+ \int_0^t \int_{T^3} (n^\lambda u^\lambda \otimes u^\lambda) : \nabla u^0 dx d\tau + \kappa \int_0^t \int_{T^3} (\nabla n^\lambda \otimes \nabla n^\lambda) : \nabla u^0 dx d\tau$$

$$- 2\mu \int_0^t \int_{T^3} n^\lambda D(u^\lambda) : D(u^0) dx d\tau - \int_0^t \int_{T^3} (\nabla \psi^\lambda \times \nabla \psi^\lambda) : \nabla u^0 dx d\tau, \quad (2.1)$$

where we have used $\text{div} u^0 = 0$ and the following relations

$$n^\lambda \nabla \Delta n^\lambda = \frac{1}{2} \nabla \Delta (n^\lambda)^2 - \frac{1}{2} \nabla |\nabla n^\lambda|^2 - \text{div}(\nabla n^\lambda \otimes \nabla n^\lambda),$$

$$- n^\lambda \nabla \psi^\lambda = - \frac{\nabla \psi^\lambda}{\lambda} + \Delta \psi^\lambda \nabla \psi^\lambda = - \frac{\nabla \psi^\lambda}{\lambda} + \text{div}(\nabla \psi^\lambda \otimes \nabla \psi^\lambda) - \frac{1}{2} \nabla |\nabla \psi^\lambda|^2.$$

Multiplying (1.4) by $u^0$ and using the property

$$\int_0^t \int_{T^3} (u^0 \cdot \nabla) u^0 \cdot u^0 dx = \frac{1}{2} \int_0^t \int_{T^3} u^0 \cdot \nabla |u^0|^2 dx d\tau = 0 \quad (2.2)$$

we find that the energy identity of the incompressible Euler equations reads

$$\frac{1}{2} \frac{d}{dt} \int_{T^3} |u^0|^2 dx = 0.$$

which implies that
\[
\frac{1}{2} \int_{\mathbb{T}^3} |u^0|^2 dx = \frac{1}{2} \int_{\mathbb{T}^3} |u_0^0|^2 dx. \quad (2.3)
\]

Using (2.1), (2.3) and the energy inequality (1.10) by integration by parts we can calculate \( H^\lambda(t) \) as follows.

\[
H^\lambda(t) + 2\mu \int_0^t \int_{\mathbb{T}^3} n^\lambda |D(u^\lambda)|^2 dx d\tau = E^\lambda(t) + 2\mu \int_0^t \int_{\mathbb{T}^3} n^\lambda |D(u^\lambda)|^2 dx d\tau
\]
\[
+ \frac{1}{2} \int_{\mathbb{T}^3} |u^0|^2 dx + \frac{1}{2} \int_{\mathbb{T}^3} (n^\lambda - 1)|u^0|^2 dx - \int_{\mathbb{T}^3} n^\lambda u^\lambda \cdot u^0 dx
\]
\[
\leq E^\lambda(0) + \frac{1}{2} \int_{\mathbb{T}^3} |u_0^0|^2 dx - \int_{\mathbb{T}^3} n^\lambda u_0^\lambda \cdot u_0^0 dx + \frac{1}{2} \int_{\mathbb{T}^3} (n^\lambda - 1)|u^0|^2 dx
\]
\[
- \int_0^t \int_{\mathbb{T}^3} n^\lambda u^\lambda \cdot \partial_\tau u^0 dx d\tau - \int_0^t \int_{\mathbb{T}^3} (n^\lambda u^\lambda \otimes u^\lambda) : \nabla u^0 dx d\tau
\]
\[
- \kappa \int_0^t \int_{\mathbb{T}^3} (\nabla n^\lambda \otimes \nabla n^\lambda) : \nabla u^0 dx d\tau + \int_0^t \int_{\mathbb{T}^3} (\nabla \Psi^\lambda \otimes \nabla \Psi^\lambda) : \nabla u^0 dx d\tau
\]
\[
+ 2\mu \int_0^t \int_{\mathbb{T}^3} n^\lambda D(u^\lambda) : D(u^0) dx d\tau = H^\lambda(0) - \frac{1}{2} \int_{\mathbb{T}^3} (n^\lambda - 1)|u_0^0|^2 dx
\]
\[
+ \frac{1}{2} \int_{\mathbb{T}^3} (n^\lambda - 1)|u^0|^2 dx - \int_0^t \int_{\mathbb{T}^3} n^\lambda u^\lambda \cdot \partial_\tau u^0 dx d\tau
\]
\[
- \int_0^t \int_{\mathbb{T}^3} (n^\lambda u^\lambda \otimes u^\lambda) : \nabla u^0 dx d\tau - \kappa \int_0^t \int_{\mathbb{T}^3} (\nabla n^\lambda \otimes \nabla n^\lambda) : \nabla u^0 dx d\tau
\]
\[
+ \int_0^t \int_{\mathbb{T}^3} (\nabla \Psi^\lambda \otimes \nabla \Psi^\lambda) : \nabla u^0 dx d\tau + 2\mu \int_0^t \int_{\mathbb{T}^3} n^\lambda D(u^\lambda) : D(u^0) dx d\tau
\]
\[
= I_1 + I_2 + I_3 + I_4 + I_5 + I_6 + I_7 + I_8. \quad (2.4)
\]

Next, we begin to treat the nine integrals \( I_k(k = 1, 2, \ldots, 8) \) term by term. To estimate the term \( I_1 \), we need to prove the following lemma.

**Lemma 1.** Assume that \( n_0^\lambda \) satisfies (1.11). Then there exists a constant \( C > 0 \) such that for \( \forall \lambda \in (0, 1) \)

\[
\|n_0^\lambda - 1\|_{L^\infty([0,T];L^\gamma(\mathbb{T}^3))} \leq C\lambda^{\min\{\frac{1}{2}, \frac{1}{4}\}}.
\]

**Proof.** We can deduce the following basic fact: for all \( x \geq 0 \) and for \( \forall R \in (1, +\infty) \),

\[
x^{\gamma} - 1 - (\gamma - \epsilon)(x - 1) + \frac{\epsilon}{2} \left( \frac{1}{x^2} - 1 \right) \geq c_1|x - 1|^\gamma \quad \text{if} \quad \gamma \geq 2,
\]
\[
x^{\gamma} - 1 - (\gamma - \epsilon)(x - 1) + \frac{\epsilon}{2} \left( \frac{1}{x^2} - 1 \right) \geq c_2|x - 1|^2 \quad \text{if} \quad \gamma < 2, \quad x \leq R,
\]
\[
x^{\gamma} - 1 - (\gamma - \epsilon)(x - 1) + \frac{\epsilon}{2} \left( \frac{1}{x^2} - 1 \right) \geq c_3|x - 1|^\gamma \quad \text{if} \quad \gamma < 2, \quad x > R,
\]
where,

\[ c_1 = \min \left\{ 1, \frac{3\epsilon}{\gamma(\gamma - 1)} \right\}, \quad c_2 = \frac{3\epsilon}{2R^3}, \quad c_3 = \left( \frac{R}{R - 1} \right)^{\gamma - 2}. \]

Hence, for \( \gamma \geq 2 \), we have

\[
\| n_0^\lambda - 1 \|^\gamma_{L^\gamma(T^3)} \leq C \int_{T^3} h(n_0^\lambda)dx \leq C\lambda. \tag{2.5}
\]

For \( \gamma < 2 \), using Hölder’s inequality, we have

\[
\| n_0^\lambda - 1 \|^\gamma_{L^\gamma(T^3)} \leq C \left( \int_{\{ n_0^\lambda \leq R \}} |n_0^\lambda - 1|^2 dx \right)^{\frac{\gamma}{2}} + \int_{\{ n_0^\lambda > R \}} |n_0^\lambda - 1|^{\gamma} dx \\
\leq C \left( \int_{\{ n_0^\lambda \leq R \}} h(n_0^\lambda)dx \right)^{\frac{\gamma}{2}} + C \int_{\{ n_0^\lambda > R \}} h(n_0^\lambda)dx \leq C(\lambda^{\frac{\gamma}{2}} + \lambda) \leq C\lambda^{\frac{\gamma}{2}}. \tag{2.6}
\]

The inequalities (2.5) and (2.6) finish the proof. \( \square \)

Using Lemma 1, we have

\[
\int_{T^3} n_0^\lambda |u_0^\lambda - u_0|^2 dx \leq 2 \int_{T^3} \left| \sqrt{n_0^\lambda} u_0^\lambda - u_0^0 \right|^2 dx + 2 \int_{T^3} \left| 1 - \sqrt{n_0^\lambda} u_0^0 \right|^2 dx \\
\leq 2 \int_{T^3} \left| \sqrt{n_0^\lambda} u_0^\lambda - u_0^0 \right|^2 dx + C \int_{T^3} \left| 1 - \sqrt{n_0^\lambda} \right|^2 dx \\
\leq 2 \int_{T^3} \left| \sqrt{n_0^\lambda} u_0^\lambda - u_0^0 \right|^2 dx + C \int_{T^3} \left| 1 - n_0^\lambda \right|^{\gamma} dx \leq C\lambda^{\min\{\frac{\gamma}{2},1\}},
\]

where we have used the following elementary inequality

\[
|1 - \sqrt{x}|^2 \leq C|1 - x|^{\gamma}, \quad \gamma > 1 \tag{2.7}
\]

for some positive constant \( C \) and \( \forall x \geq 0 \). Then, from (1.11), we get

\[
I_1 = H^\lambda(0) \leq C\lambda^{\min\{\frac{\gamma}{2},1\}}. \tag{2.8}
\]

The integrals \( I_2 \) and \( I_3 \) cancel with a contribution originating from \( I_5 \) (see below). Using (1.4), we have

\[
I_4 = \int_0^t \int_{T^3} n^\lambda u^\lambda \cdot ((u^0 \cdot \nabla)u^0 + \nabla p^0) dxd\tau \\
= \int_0^t \int_{T^3} n^\lambda u^\lambda \cdot ((u^0 \cdot \nabla)u^0) dxd\tau + \int_0^t \int_{T^3} n^\lambda u^\lambda \cdot \nabla p^0 dxd\tau.
\]

In fact, we only need to treat the second term on the right hand side of the above inequality and the first term will be canceled later (See (2.10)). Using
the $L^\infty([0,T]; L^2(\mathbb{T}^3))$ bound on $\nabla \Psi^\lambda$ due to the energy inequality (1.10), the continuity equation (1.5) and Poisson equation (1.7), we get

\[
\int_0^t \int_{\mathbb{T}^3} n^\lambda u^\lambda \cdot \nabla p^0 dx d\tau = -\lambda \int_0^t \int_{\mathbb{T}^3} \Delta (\partial_\tau \Psi^\lambda) p^0 dx d\tau \\
= \lambda \int_0^t \int_{\mathbb{T}^3} \nabla (\partial_\tau \Psi^\lambda) \cdot p^0 dx d\tau = \lambda \int_{\mathbb{T}^3} \nabla \Psi^\lambda \cdot p^0 dx - \lambda \int_{\mathbb{T}^3} \nabla \psi^\lambda \cdot p_0^0 dx \\
- \lambda \int_0^t \int_{\mathbb{T}^3} \nabla \Psi^\lambda \cdot \partial_\tau \nabla p^0 dx d\tau \leq C\lambda.
\]

Therefore, we have that

\[
I_4 \leq \int_0^t \int_{\mathbb{T}^3} n^\lambda u^\lambda \cdot ((u^0 \cdot \nabla)u^0) dx d\tau + C\lambda. \tag{2.9}
\]

In order to treat the term $I_5$, we add and subtract the expression $u^0$ such that

\[
I_5 = \int_0^t \int_{\mathbb{T}^3} n^\lambda (u^\lambda - u^0) \otimes (u^\lambda - u) : \nabla u^0 dx d\tau - \int_0^t \int_{\mathbb{T}^3} (n^\lambda u^0 \otimes u^\lambda) : \nabla u^0 dx d\tau \\
+ \int_0^t \int_{\mathbb{T}^3} (n^\lambda u^0 \otimes u^0) : \nabla u^0 dx d\tau - \int_0^t \int_{\mathbb{T}^3} (n^\lambda u^\lambda \otimes u^0) : \nabla u^0 dx d\tau \\
\leq C \int_0^t \mathcal{H}^\lambda (\tau) d\tau - \int_0^t \int_{\mathbb{T}^3} n^\lambda u^\lambda \cdot ((u^0 \cdot \nabla)u^0) dx d\tau + I_{51} + I_{52},
\]

where,

\[
I_{51} = \int_0^t \int_{\mathbb{T}^3} (n^\lambda u^0 \otimes u^0) : \nabla u^0 dx d\tau, \quad I_{52} = \int_0^t \int_{\mathbb{T}^3} (n^\lambda u^\lambda \otimes u^0) : \nabla u^0 dx d\tau.
\]

Using the uniform bound on $\nabla \Psi^\lambda$ due to the energy inequality (1.10), the Poisson equation (1.7), the equality (2.2) and integration by parts, we get

\[
I_{51} = \int_0^t \int_{\mathbb{T}^3} n^\lambda (u^0 \cdot \nabla)u^0 \cdot u^0 dx d\tau = \int_0^t \int_{\mathbb{T}^3} (n^\lambda - 1)(u^0 \cdot \nabla)u^0 \cdot u^0 dx d\tau \\
= \lambda \int_0^t \int_{\mathbb{T}^3} \nabla \Psi^\lambda \cdot \nabla ((u^0 \cdot \nabla)u^0 \cdot u^0) dx d\tau \leq C\lambda.
\]

Similarly, we have

\[
I_{52} = -\frac{1}{2} \int_0^t \int_{\mathbb{T}^3} n^\lambda u^\lambda \cdot \nabla |u^0|^2 dx d\tau = -\frac{1}{2} \int_0^t \int_{\mathbb{T}^3} \partial_\tau (n^\lambda - 1)|u^0|^2 dx d\tau \\
= -\frac{1}{2} \int_{\mathbb{T}^3} (n^\lambda - 1)|u^0|^2 dx + \frac{1}{2} \int_{\mathbb{T}^3} (n_0^\lambda - 1)|u_0^0|^2 dx \\
+ \frac{1}{2} \int_0^t \int_{\mathbb{T}^3} (n^\lambda - 1) \partial_\tau |u|^2 dx d\tau.
\]
The bound on the above inequality can be canceled by the first term on the right hand side of (2.9). Meanwhile, we notice that the first term on the right hand side of the above inequality is bounded in time for all $n$. Therefore, we have

$$I_5 \leq - \int_0^t \int_{\mathbb{T}^3} n^\lambda u^\lambda \cdot (u^0 \cdot \nabla) u^0 \, dx \, d\tau - \frac{1}{2} \int_{\mathbb{T}^3} (n^\lambda - 1)|u^0|^2 \, dx + \frac{1}{2} \int_{\mathbb{T}^3} (n_0^\lambda - 1)|u_0^0|^2 \, dx + C\lambda.$$

Then, we have

$$I_2 + I_3 + I_5 \leq - \int_0^t \int_{\mathbb{T}^3} n^\lambda u^\lambda \cdot (u^0 \cdot \nabla) u^0 \, dx \, d\tau + C\lambda. \quad (2.10)$$

For the terms $I_6$ and $I_7$, it is easy to get

$$I_6 + I_7 \leq C \|\nabla u^0\|_{L^\infty(0,T;L^\infty(\mathbb{T}^3))} \int_0^t \int_{\mathbb{T}^3} (|\nabla n^\lambda|^2 + |\nabla \Psi^\lambda|^2) \, dx \, d\tau \leq C \int_0^t \mathcal{H}(\tau) \, d\tau.$$

Finally, we deal with $I_8$. In view of Proposition 2, using the $L^\infty([0,T];L^\gamma(\mathbb{T}^3))$ bound on $n^\lambda$, we deduced that $\sqrt{n^\lambda}$ is bounded in $L^\infty([0,T];L^{2\gamma}(\mathbb{T}^3))$ (then in $L^\infty([0,T];L^2(\mathbb{T}^3))$) because $\gamma > 1$) which combined with the $L^2([0,T];L^2(\mathbb{T}^3))$ bound on $\sqrt{n^\lambda} \nabla u^\lambda$ gives

$$I_8 = 2\mu \int_0^t \int_{\mathbb{T}^3} \nabla u^\lambda \cdot \sqrt{n^\lambda} \sqrt{n^\lambda} D(u^\lambda) : \nabla u^0 \, dx \, d\tau \leq C \mu \int_0^t \int_{\mathbb{T}^3} \sqrt{n^\lambda} |D(u^\lambda)| \, dx \, d\tau \leq C\mu + 2\mu \int_0^t \int_{\mathbb{T}^3} n^\lambda |D(u^\lambda)|^2 \, dx \, d\tau. \quad (2.11)$$

Putting the estimates (2.8)–(2.11) into (2.4) and using the assumption $\mu = O(\lambda)$, we obtain

$$\mathcal{H}(t) \leq C \int_0^t \mathcal{H}(\tau) \, d\tau + C\lambda \min\{\frac{1}{\lambda}, 1\}$$

for all $t \in [0,T]$. With the help of Gronwall inequality, we get that

$$\mathcal{H}'(t) \leq C\lambda \min\{\frac{1}{\lambda}, 1\}, \quad t \in [0,T],$$

which implies that the results (1.14) and (1.15) hold. Analogous to the proof of Lemma 1, we can easily prove the result (1.12), namely

$$\|n^\lambda - 1\|_{L^\infty([0,T];L^\gamma(\mathbb{T}^3))} \leq C\lambda \min\{\frac{1}{\lambda}, 1\}.$$
Using Lemma 1, the inequality (1.9), the inequality (2.7) and the Hölder inequality, we have that
\[
\|\sqrt{n} \lambda^\alpha u - u^0\|_{L^2(T^3)}^2 \leq 2\|\sqrt{n} \lambda^\alpha (u - u^0)\|_{L^2(T^3)}^2 + 2\|(1 - \sqrt{n})u^0\|_{L^2(T^3)}^2 \\
\leq C\lambda^\min\{\frac{2}{\gamma + 1}\} + C\|1 - n\lambda^\gamma\|_{L^\gamma(T^3)} \leq C\lambda^\min\{\frac{2}{\gamma + 1}\}
\]
for any \(t \in [0, T]\). Therefore, we conclude that (1.13) holds. Using the Hölder inequality and the fact \(1 < \frac{2\gamma}{\gamma + 1} < \gamma\), we have
\[
\|n^\gamma u^\lambda - u^0\|_{L^\frac{2\gamma}{\gamma + 1}(T^3)}^2 \leq 2\|n^\gamma (u^\lambda - u^0)\|_{L^\frac{2\gamma}{\gamma + 1}(T^3)}^2 + 2\|(n^\lambda - 1)u^0\|_{L^\frac{2\gamma}{\gamma + 1}(T^3)}^2 \\
\leq 2\|\sqrt{n}\|_{L^2(T^3)}^2 \|\sqrt{n}^\gamma (u^\lambda - u^0)\|_{L^2(T^3)} + 2\|n^\lambda - 1\|_{L^\gamma(T^3)} \|u^0\|_{L^\frac{2\gamma}{\gamma + 1}(T^3)}^2 \leq C\lambda^\min\{\frac{2}{\gamma + 1}\}.
\]
So we conclude that (1.16) holds. Thus the proof of Theorem 1 is finished. \(\square\)
